FrameCheck

META GLOBAL AI DEVELOPER HACKATHON

Indie Developer track · Build for Your World

DOES THE BUILD *MATCH* THE DESIGN?

FrameCheck lays a screenshot of the build over the design export and asks **Meta Muse Spark** what went wrong: elements that went missing, text that got cut off, things that moved. Every finding comes with **a box on both images**, and **a person decides** what is real.

MISSING ELEMENT
The promo code row is in the design, gone from the build.

CLIPPED TEXT
The first product title is cut off.

LAYOUT MISMATCH
The pay button is narrower than designed.

HOW IT WORKS

Five steps, one screen each

01 — Capture
Design export and build screenshot at the same viewport and pixel ratio.

02 — Pair
Upload both, add a note on what matters on the page.

03 — Analyse
One Muse Spark request with both images returns structured findings.

04 — Review
Zoom both images to the same spot; accept, or reject with a reason.

05 — Export
Markdown for the pull request, JSON for your tools.

BUILT ON META MUSE SPARK

Model output you can check

- **Strict JSON schema** output: category, summary, check step, a box per image.
- **Coordinate contract:** the model's 0–1000 grid is mapped back to original pixels.
- **Untrusted by default:** each finding is checked against its category's evidence rules.
- **Prompt-safe notes**, a request cap, duplicate detection and token accounting.
- **Honest origins:** Muse Spark, fixture and mock runs are always labelled.

LIVE RESULTS SO FAR

Real runs, injected defects

12 / 12
injected defects found in 4 live Muse Spark runs

0
false positives in those runs

≈ 13 s
per analysis, one request, two images

0.92–0.96
box overlap (IoU) on missing and layout findings

4 runs on 2 image pairs with 3 known defects each. The benchmark on the 27 labelled dev and holdout pairs is still to run.
